# How to Delete Vultr Two-factor Authentication

## Introduction

Deleting two-factor authentication (2FA) allows you to log in to your Vultr account using a username and a password without requiring an authentication code. If you lose access to your 2FA device, log in with your 2FA emergency backup code, delete the active 2FA entry, and re-enable 2FA.

Follow this guide to delete two-factor authentication using the Vultr Customer Portal.

1. Navigate to **Account** and select **Authentication** under **General**.
2. Click **Manage Two Factor Authentication**.
3. Remove the 2FA entry by clicking the delete icon and entering the access code in the confirmation prompt.

The screenshot displays the 'Manage Two Factor Authentication' page. At the top, there is a title and a brief instruction: 'Keep your account secure by enabling two-factor authentication. Each time you log in, you'll be required to provide your password plus a randomly generated access code.' Below this, there is a form to add a new 2FA entry with a dropdown menu set to 'Google Auth' and a 'Description' field. A list of existing 2FA entries is shown below, including 'Google Auth' (added 2025-04-08 16:09:52) and 'Backup' (added 2025-04-08 16:13:30). Each entry has a trash icon to its right. A red box highlights the trash icon for the 'Google Auth' entry. To the right of the main interface, a 'Verify 2FA Removal' dialog box is open, asking the user to 'Please enter your 2FA code to confirm removal'. The dialog contains a text input field with 'xxxxxx' and 'Confirm' and 'Cancel' buttons. A red box highlights the 'Confirm' button.
