# vultr\_inference

---

## Introduction

---

Get information about a Vultr Serverless Inference subscription.

## Example Usage

---

Get the information for an inference subscription by `label`:

HCL

```
data "vultr_inference" "example_inference" {
  filter {
    name   = "label"
    values = ["my_inference_label"]
  }
}
```

## Argument Reference

---

The following arguments are supported:

- `filter` - (Required) Query parameters for finding inference subscriptions.

The `filter` block supports the following:

- `name` - Attribute name to filter with.
- `values` - One or more values filter with.

# Attributes Reference

---

The following attributes are exported:

- `date_created` - The date the inference subscription was added to your Vultr account.
- `label` - The inference subscription's label.
- `api_key` - The inference subscription's API key for accessing the Vultr Inference API.
