vultr_os

Introduction

Get information about operating systems that can be launched when creating a Vultr VPS.

Example Usage

Get the information for an operating system by `name`:

HCL

```
data "vultr_os" "centos" {
  filter {
    name   = "name"
    values = ["CentOS 7 x64"]
  }
}
```

Argument Reference

The following arguments are supported:

- `filter` - (Required) Query parameters for finding operating systems.

The `filter` block supports the following:

- `name` - Attribute name to filter with.
- `values` - One or more values filter with.

Attributes Reference

The following attributes are exported:

- `name` - The name of the operating system.
- `arch` - The architecture of the operating system.
- `family` - The family of the operating system.
