vultr_region

Introduction

Get information about a Vultr region.

Example Usage

Get the information for a region by `id`:

HCL

```
data "vultr_region" "my_region" {
  filter {
    name   = "id"
    values = ["sea"]
  }
}
```

Argument Reference

The following arguments are supported:

- `filter` - (Required) Query parameters for finding regions.

The `filter` block supports the following:

- `name` - Attribute name to filter with.
- `values` - One or more values filter with.

Attributes Reference

The following attributes are exported:

- `continent` - The continent the region is in.
- `country` - The country the region is in.
- `city` - The city the region is in.
- `options` - Shows whether options like ddos protection or block storage are available in the region.
